

IOS Essentials

Essential Features every ISP should Consider
Version 3.15

Overview

- **IOS Software and Router Management**
- **General Features**
- **Routing Configuration Guidelines**
- **Securing the Router**
- **Securing the Network**

Which IOS?

- **IOS is a feature rich and highly complex router control system**
- **ISPs should choose the IOS variant which is most appropriate for the intended application**
- **There is an exclusive service provider train in IOS**
 - This is 12.0S, supporting 7200, 7500, 10000 and 12000
- **There is a service provider image in most IOS releases**

This is the image with –p– in its name, for example:

c7200-p-mz.122-8.T1 and c2600-p-mz.121-14

The –p– image is IP-only plus ISIS/CLNS

Which IOS?

- **12.*n* – for example 12.4**

This means the IOS is a mainline image

NO new features

ONLY bug fixes

The aim is stability!

- **12.*nT* – for example 12.4T**

This means the IOS is the technology release

NEW features

Bug fixes

Avoid unless you need the feature!

12.3 IOS release images

- **12.3 is the old “mainline” train**
 - Originated from 12.2T, currently at 12.3(17a)**
 - Bug fix release only – aiming for stability**
 - Supports more platforms and has more features than 12.2 or 12.1**
- **12.3T was the old “technology train”**
 - new features introduced in IOS 12.3**
 - Last release was 12.3(14)T6**
- **Available on CCO, supported by TAC**

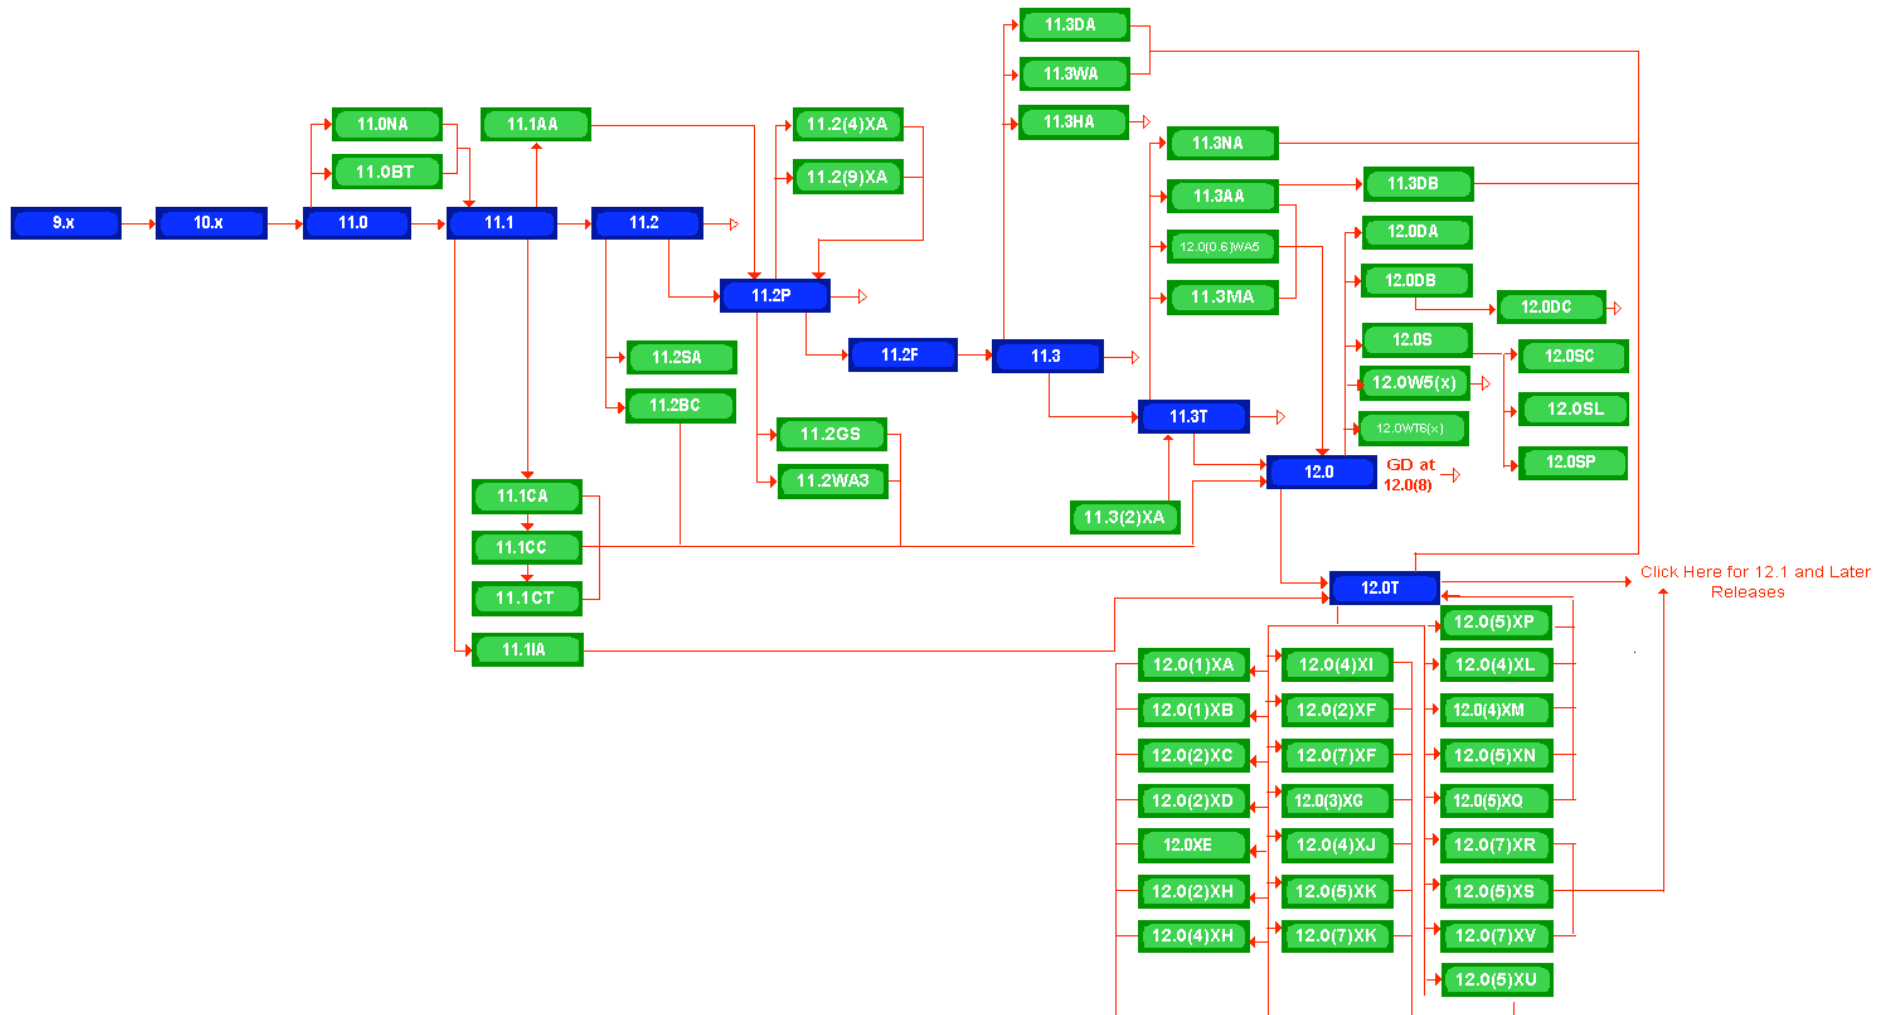

12.4 IOS release images

- **12.4 is the current “mainline” train**
Originated from 12.3T, currently at 12.4(5a)
Bug fix release only – aiming for stability
Supports more platforms and has more features than 12.3
- **12.4T is the current “technology train”**
new features introduced in IOS 12.4
Currently at 12.4(4)T1
- **Available on CCO, supported by TAC**

IOS images for ISPs

- **12.0S is the release for all ISPs**
For 7200, 7500, 10000 and GSR/12000 only
Currently at 12.0(32)S1
- **12.2S is a new ISP release**
For 7x00 series (x = 2, 3, 5 and 6)
Combines 12.0S and 12.1E enhancements
Currently at 12.2(25)S8
- **Available on CCO, supported by TAC**

Cisco IOS Roadmap

<http://www.cisco.com/warp/public/620/roadmap.shtml>

IOS Software Management

Flash Memory

- **Good practice is to have at least two distinct flash memory volumes**
 - allows backup image(s)**
 - back out path in case of upgrade problems**
- **Either:**
 - Partition the built-in flash (if possible):**
`partition flash 2 16 16`
- **Or:**
 - Install PCMCIA/Compact flash in external slot(s)**

IOS Software Management

Flash Memory

- **Ensure there is a configured backup for the selected IOS image**

Backup image is previous good image

```
boot system flash slot0:rsp-k4pv-mz.120-23.S1
```

```
boot system flash slot1:rsp-k4pv-mz.120-21.S5
```

```
boot system flash
```

Which means:

Boot quoted image from slot0:. If it isn't there, boot the quoted image in slot1:. If that isn't there, try the first image available in flash

IOS Software Management

System Memory

- **Good practice is to maximise router memory**
allows for the rapidly growing Internet
- **At least 128Mbytes RAM needed for full Internet routing table**
Most routers these days come with 256Mbytes or more
- **Recognised that equipment works best when “left alone”**

IOS Software Management

When to Upgrade

- **Upgrades needed when:**
 - bug fixes released
 - new hardware support
 - new software features required
- **Otherwise:**

If it isn't broken, don't fix it!

Configuration Management

- **Backup NVRAM configuration off the router:**
 - write configuration to TFTP server**
 - TFTP server files kept under revision control**
 - router configuration built from master database**
 - Use a Public Domain utility such as RANCID**
www.shrubbery.net/rancid/
- **Allows rapid recovery in case of emergency**

Larger Configurations

- **Compress Configuration**

Used when configuration required is larger than configuration memory (NVRAM) available.

```
service compress-config
```

- **FLASH or remote server**

Used when NVRAM compression is not enough

Command Line Interface Features

- **Some Convenient Editing Keys**

TAB	command completion
arrow keys	scroll history buffer
ctrl A	beginning of line
ctrl E	end of line
ctrl K	delete all chars to end of line
ctrl X	delete all chars to beginning of line
ctrl W	delete word to left of cursor
esc B	back one word
esc F	forward one word

Command Line Interface Features

- **CLI has string searches**

```
show configuration | [begin|include|exclude] <regexp>
```

- **Pager “--more--” has string searches**

```
/<regexp>, -<regexp>, +<regexp>
```

- **“More” command has string searches**

```
more <filename> | [begin|include|exclude] <regexp>
```

Use detailed logging

- **Off load logging information to a logging server.**
- **Use the full detailed logging features to keep exact details of the activities.**

```
service timestamps debug datetime msec localtime show-timezone
service timestamps log datetime msec localtime show-timezone
no logging console
logging buffered 16384
logging trap debugging
logging facility local7
logging 169.223.32.1
logging 169.223.35.8
logging source-interface loopback0
```

Network Time Protocol

- **If you want to cross compare logs, you need to synchronize the time on all the devices.**
- **Use NTP**
 - from external time source**
 - Upstream ISP, Internet, GPS, atomic clock**
 - from internal time source**
 - router can act as stratum 1 time source**

Network Time Protocol

- **Set timezone**

```
clock timezone <name> [+/-hours [mins]]
```

- **Router as source**

```
ntp master 1
```

- **External time source (master)**

```
ntp server a.b.c.d
```

- **External time source (equivalent)**

```
ntp peer e.f.g.h
```

Network Time Protocol

- **Example Configuration:**

```
clock timezone SST 8
ntp update-calendar
ntp source loopback0
ntp server <other time source>
ntp peer <other time source>
ntp peer <other time source>
```

SNMP

- Remove any SNMP commands if SNMP is not going to be used.
- If SNMP is going to be used:

```
access-list 98 permit 169.223.1.1
access-list 98 deny    any
snmp-server community 5nmc02m RO 98
snmp-server trap-source Loopback0
snmp-server trap-authentication
snmp-server host 169.223.1.1 5nmc02m
```

HTTP Server

- **HTTP Server in IOS since 11.1CC and 12.0S**
router configuration via web interface

- **Disable if not going to be used:**

```
no ip http server
```

- **Configure securely if going to be used:**

```
ip http server
```

```
ip http port 8765
```

```
ip http authentication aaa
```

```
ip http access-class <1-99>
```

Core Dumps

- Cisco routers have a *core dump* feature that will allow ISPs to transfer a copy of the core dump to a specific FTP server.
- Set up a FTP account on the server the router will send the core dump to.
- The server should NOT be a public server
 - use filters and secure accounts
 - locate in NOC with network operations staff access only

Core Dumps

- **Example configuration:**

```
ip ftp username cisco
ip ftp password 7 045802150C2E
ip ftp source-interface loopback 0
exception protocol ftp
exception dump 169.223.32.1
```

General Features

Interface Configuration

- **“ip unnumbered”**
 - no need for an IP address on point-to-point links**
 - keeps IGP small**
- **“description”**
 - customer name, circuit id, cable number, etc**
 - on-line documentation!**
- **“bandwidth”**
 - used by IGP**
 - documentation!**

Interface Configuration – Example

- **ISP router**

```
!  
interface loopback 0  
description Loopback interface on GW2 Router  
ip address 215.17.3.1 255.255.255.255  
!  
interface Serial 5/0  
description 128K HDLC link to Galaxy  
Publications Ltd [galpub1] WT50314E R5-0  
bandwidth 128  
ip unnumbered loopback 0  
!  
ip route 215.34.10.0 255.255.252.0 Serial 5/0
```

- **Customer router**

```
!  
interface Ethernet 0  
description Galaxy Publications LAN  
ip address 215.34.10.1 255.255.252.0  
!  
interface Serial 0  
description 128K HDLC link to Galaxy Internet  
Inc WT50314E C0  
bandwidth 128  
ip unnumbered ethernet 0  
!  
ip route 0.0.0.0 0.0.0.0 Serial 0
```

Interface Status Checking

- **show interface switching**

Hidden command which provides information about the switching status of the router interfaces

- **show interface stats**

Hidden command which provides inbound and outbound packet information on the router interfaces

- **show idb (interface descriptor blocks)**

Shows how many IDBs are configured on the router

Early routers (such as AGS+) could only support 300 IDBs

NetFlow

- **Provides network administrators with “packet flow” information**
- **Allows:**
 - security monitoring**
 - network management and planning**
 - customer billing**
 - traffic flow analysis**
- **Available since 11.1CC for 7x00 and 12.0 for remaining router platforms**

NetFlow – Capacity Planning

Public Routers 1 , 2, 3 Month of September Outbound Traffic

WEC	WebTV	ABSNET	AOL	Compuserve
SURAnet	IBM	OARNet	NIH	PacBell Internet Service
JHU	C&W	UMD	AT&T	BBN
Erols	Digex	Other		

NetFlow

- **Configuration example:**

```
interface serial 5/0  
  ip route-cache flow
```

- **If CEF not configured, NetFlow enhances existing switching path**
- **If CEF configured, NetFlow becomes a flow information gatherer**

NetFlow

- **Information export:**

router to collector system

```
ip flow-export version 5 [origin-as|peer-as]
```

```
ip flow-export destination x.x.x.x <udp-port>
```

- **Flow aggregation (new in 12.0S):**

router sends aggregate records to collector system

```
ip flow-aggregation cache as|prefix|dest|source|proto  
enabled
```

```
export destination x.x.x.x <udp-port>
```

NetFlow

- **Public domain NetFlow data collector**

cflowd (no longer maintained)

<http://www.caida.org/tools/measurement/cflowd/>

flow-tools

<http://www.splintered.net/sw/flow-tools/>

- **Public domain NetFlow data analyser**

Flowscan – works with cflowd

<http://www.caida.org/tools/utilities/flowscan/>

NetFlow

Sample Router Output

IP packet size distribution (250064161 total packets):

1-32	64	96	128	160	192	224	256	288	320	352	384	416	448	480
.001	.436	.129	.047	.067	.017	.010	.011	.008	.006	.007	.011	.007	.004	.004
512	544	576	1024	1536	2048	2560	3072	3584	4096	4608				
.005	.002	.035	.018	.167	.000	.000	.000	.000	.000	.000				

IP Flow Switching Cache, 278544 bytes

1629 active, 2467 inactive, 47488016 added

672172037 age polls, 0 flow alloc failures

Active flows timeout in 30 minutes

Inactive flows timeout in 15 seconds

IP Sub Flow Cache, 49800 bytes

1629 active, 1443 inactive, 47488015 added, 47488015 added to flow

0 alloc failures, 507 force free

3 chunks, 420 chunks added

last clearing of statistics never

Protocol	Total	Flows	Packets	Bytes	Packets	Active(Sec)	Idle(Sec)
-----	Flows	/Sec	/Flow	/Pkt	/Sec	/Flow	/Flow

Using DNS

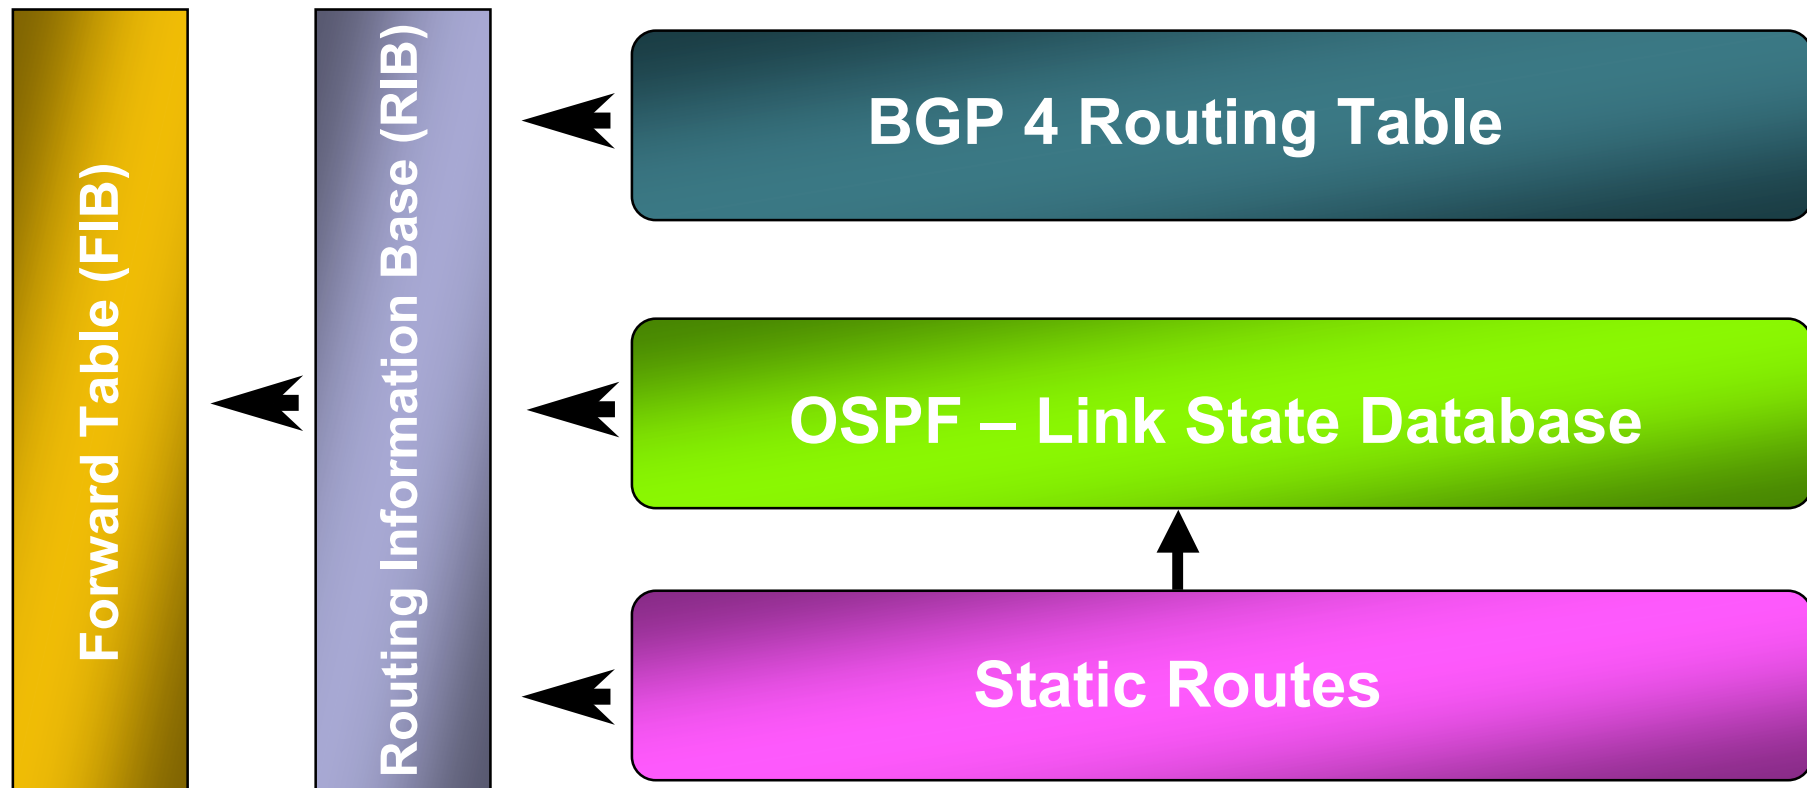

- Map names to addresses
- Descriptive names
 - `ip domain-name`
 - `ip nameserver`
- Sample trace through network:

```
4:Received echo from sj-wall-2.cisco.com [198.92.1.138] in 440 msec
5:Received echo from barrnet-gw.cisco.com [192.31.7.37] in 335 msec
6:Received echo from paloalto-cr1.bbnplanet.net [131.119.26.9] in 335 msec
7:Received echo from paloalto-br2.bbnplanet.net [131.119.0.194] in 327 msec
8:Received echo from core6-hssi6-0.SanFrancisco.mci.net [206.157.77.21] in 468 msec
9:Received echo from bordercore1-loopback.Washington.mci.net[166.48.36.1] in 454 msec
10:Received 48 bytes from www.getit.org [199.233.200.55] in 466 msec
```

Routing

Routing Tables Feed the Forwarding Table

HSRP

- **Hot Standby Routing Protocol**

virtual default gateway for dumb system LAN

transparent cut-over in case of failure

Router1:

```
interface ethernet 0/0
description Service LAN
ip address 169.223.10.1 255.255.255.0
standby 10 ip 169.223.10.254
```

Router2:

```
interface ethernet 0/0
description Service LAN
ip address 169.223.10.2 255.255.255.0
standby 10 priority 150
standby 10 preempt
standby 10 ip 169.223.10.254
```

CIDR Features

- The Internet is a **classless** world. All routers connect to the Internet must be CIDR compliant, else there will be problems with the network connection to the Internet.
- All Cisco routers should have the following commands configured for CIDR:

```
ip subnet-zero
```

```
ip classless
```
- These are default from IOS 12.0 onwards

Selective Packet Discard

- **When a link goes to a saturated state, you will drop packets. The problem is that you will drop any type of packets – Including your routing protocols.**
- **Selective Packet Discard (SPD) will attempt to drop non-routing packets instead of routing packets when the link is overloaded.**

`ip spd enable`

- **Enabled by default from 11.2(5)P and later releases, available option in 11.1CA/CC.**

Source Routing

- **IP has provision to allow source IP host to specify route through Internet**
- **ISPs should turn this off, unless it is specifically required:**

`no ip source-route`

BGP

- **There are key BGP features that should be configured by ISPs:**

`update-source loopback 0 (for iBGP)`

`no synchronization`

`no auto-summary`

`ip bgp-community new-format`

`bgp neighbor shutdown`

BGP Route Refresh Capability

`bgp dampening`

BGP

- **More helpful features:**

`bgp deterministic-med`

`bgp neighbor remove-private-AS`

`bgp neighbor authentication`

`bgp neighbor maximum-prefix`

`bgp neighbor maxas-limit`

`bgp log-neighbor-changes`

`no bgp fast-external-fallover`

`bgp peer-groups`

`ip prefix-lists`

iBGP configuration

- **Use loopback interface**

it never goes away

routers have multiple external paths

has multiple uses

```
interface loopback 0
```

```
ip address 215.17.1.34 255.255.255.255
```

```
router bgp 200
```

```
neighbor 215.17.1.35 remote-as 200
```

```
neighbor 215.17.1.35 update-source loopback 0
```

```
neighbor 215.17.1.36 remote-as 200
```

```
neighbor 215.17.1.36 update-source loopback 0
```

BGP Synchronization

- **By default BGP does not advertise a route before all routers in the AS have learned it via an IGP**

i.e., if the prefix isn't in the IGP, BGP won't announce it

- **Synchronization should be disabled in every ISP network**

ISPs use iBGP across backbone, IGP simply provides internal reachability

no synchronization

BGP Auto Summarisation

- **Automatically summarises subprefixes to the classful network when redistributed to BGP from another routing protocol**
- **Must be turned off for any Internet connected site using BGP.**
- **Internet is classless – class A, class B and class C are no more.**

`no auto-summary`

BGP Community Format

- **Communities are used extensively**

- **Cisco IOS supports two formats**

One 32 bit integer e.g. 13107210

Two 16 bit integers e.g. 200:10

- **RFC1998 recommends 16:16 format**

Format AS:xxxx

`ip bgp-community new-format`

Route Refresh Capability

- Facilitates non-disruptive policy changes
- No configuration is needed
 - Automatically negotiated at peer establishment
- No additional memory is used
- Requires peering routers to support “route refresh capability” – RFC2918
- **clear ip bgp x.x.x.x in** tells peer to resend full BGP announcement
- **clear ip bgp x.x.x.x out** resends full BGP announcement to peer

Route Refresh Capability

- **Use Route Refresh capability if supported**
find out from “show ip bgp neighbor”
Non-disruptive, “Good For the Internet”
- **Otherwise use Soft Reconfiguration IOS feature**
`neighbor x.x.x.x soft-reconfiguration in`
- **Only hard-reset a BGP peering as a last resort**
Consider the impact to be equivalent to a router reboot

Managing Policy Changes

- **Ability to clear the BGP sessions of groups of neighbours configured according to several criteria**
- `clear ip bgp <addr> [soft] [in|out]`

<addr> may be any of the following

x.x.x.x

IP address of a peer

all peers

ASN

all peers in an AS

external

all external peers

peer-group <name>

all peers in a peer-group

Clear BGP Sessions per AS

- **Ability to clear the BGP sessions of all the neighbors configured with a specific AS number**
- **Syntax:**
clear ip bgp <as number>
- **Availability since** 11.1(14)CA,
11.1CC, 11.2(9),
11.3(2)

BGP Neighbour Shutdown

- **Shutdown BGP peering**
previously required operator to delete configuration
now can simply “shutdown” the peering
- **Configuration example:**

```
router bgp 200
  neighbor 215.7.1.1 remote-as 210
  neighbor 215.7.1.1 shutdown
```
- **Can be reactivated with**

```
no neighbor 215.7.1.1 shutdown
```

BGP Damping

- Route flap damping to minimise instability in local network and Internet

BGP Damping

- **Recommended values and sample configurations for ISPs at:**

<http://www.ripe.net/docs/ripe-229.html>

(work by European and US ISPs a few years ago as IOS defaults were considered to be too aggressive)

- **Example techniques:**

Internet Routing Architectures 2nd Edition – Sam Halabi & Danny McPherson

`bgp dampening`

Deterministic MED

- **RFC1771 said that MED is not always compared (RFC4271 fixes this over-sight)**
- **As a result, the ordering of the paths can effect the decision process**
- **By default in Cisco IOS, the prefixes are compared in order of arrival (most recent to oldest)**

Use **bgp deterministic-med** to order paths consistently

The bestpath is recalculated as soon as the command is entered

Enable in all the routers in the AS

Deterministic MED—Operation

- **The paths are ordered by Neighbour AS**
- **The bestpath for each Neighbour AS group is selected**
- **The overall bestpath results from comparing the winners from each group**
- **The bestpath will be consistent because paths will be placed in a deterministic order**

Private-AS Removal

- **Private ASes range from 64512 to 65534**
Used for internal policy – must not appear on Internet
- **neighbor x.x.x.x remove-private-AS**
- **Rules:**
 - available for eBGP neighbors only
 - if the update has AS_PATH made up of private-AS numbers, the private-AS will be dropped
 - if the AS_PATH includes private and public AS numbers, private AS number will not be removed...it is a configuration error!
 - if AS_PATH contains the AS number of the eBGP neighbor, the private-AS numbers will not be removed
 - if used with confederations, it will work as long as the private AS numbers are after the confederation portion of the AS_PATH

BGP Neighbour Authentication

- **MD5 authentication between two peers**
password must be known to both peers
- **peer-group** can be used to apply to multiple peerings

```
neighbor 169.222.10.1 password v61ne0qkel33&
```

BGP Maximum Prefix Tracking

- **Allow configuration of the maximum number of prefixes a BGP router will receive from a peer**
- **Two level control**
 - Warning threshold: log warning message**
 - Maximum: tear down the BGP peering, manual intervention required to restart**

BGP Maximum Prefix Tracking

```
neighbor <x.x.x.x> maximum-prefix <max> [<threshold>]  
[warning-only]
```

- **Threshold is an optional parameter between 1 to 100 percent**

Specify the percentage of <max> that a warning message will be generated. Default is 75%.

- **Warning-only is an optional keyword which allows log messages to be generated but peering session will not be torn down**

BGP Maximum AS Path Length

- **IOS can limit the maximum AS Path length acceptable by the router's BGP process**

`neighbor x.x.x.x maxas-limit 15`

Discards all prefixes with AS-PATH length greater than 15 prefixes

Easier and less prone to error than using a filter-list

BGP log-neighbor-changes

- Log neighbour up/down events, and the reason for the last neighbour peering reset
- Available from 11.1 CC and 12.0 releases
- Syntax (router subcommand):
[no] log-neighbor-changes
- Typical log messages:
%BGP-6-ADJCHANGE: neighbor x.x.x.x Up
%BGP-6-RESET: neighbor x.x.x.x reset
(User reset request)

Reason for Last Peer Reset

- Router keeps reason for the last BGP peer reset for each of its peers. Useful for analysing BGP session resets
- Available as part of the **show ip bgp neighbor** command output
- Accessible through SNMP
- Has been available since 11.1CC, 11.2(12) and 11.3(2)

BGP Peering

- **By default, peerings are reset immediately the line protocol to an external neighbour goes down**
bad for high latency, unreliable, long distance, or congested links
- **IOS option to disable this**
recommended in RIPE-229
uses standard keepalive/hold timers (60s/180s)

`no bgp fast-external-fallover`

BGP peer groups

- **Reduces CPU load and memory**
update generation processed once
BGP configuration simplified

```
router bgp 109
  neighbor internal peer-group
  neighbor internal remote-as 109
  neighbor internal update-source loopback 0
  neighbor 131.108.10.1 peer-group internal
  neighbor 131.108.20.1 peer-group internal
```

Prefix Lists

- **Used for filtering routing updates**
- **Much faster than access-lists (aka distribute-list)**
 - Faster loading of large lists**
 - Consider distribute-list obsolete**
- **Incremental configuration**
 - sequence numbers optional**
 - `no ip prefix-list sequence-number`
- **Available from 11.1(17)CC and 12.0**
- **Configured by:**
 - `ip prefix-list <list-name>`

Prefix Lists in BGP

- **Prefix-list should be used instead of distribute-list**

```
router bgp 200
```

```
neighbor 169.222.1.1 remote-as 200
```

```
neighbor 169.222.1.1 prefix-list FILTER-IN in
```

```
neighbor 169.222.1.1 prefix-list FILTER-OUT out
```

- **Prefix-lists and distribute-lists are mutually exclusive**

Prefix-List ORF

- **Outbound Route Filter Capability when using prefix-lists**
new from 12.0(5)S release
- **If remote BGP peer supports ORF capability, local BGP router can send inbound prefix-list to remote router**
- **Remote router installs received prefix-list in addition to its own outbound filters**
- **Reduces unwanted routing updates from peers**

Securing the Router

ISP Security

- **ISPs need to:**
 - Protect themselves**
 - Help protect their customers from the Internet**
 - Protect the Internet from their customers**

ISP Security

Where to start...

- **Project Cymru website**
www.cymru.com
- **RFC3871**
(Operational Security Requirements for Large ISP IP Network Infrastructure)
- **Cisco Internet Security Advisories**
www.cisco.com/warp/public/707/advisory.html
- **Cisco IOS Documentation**
www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fsecur_c/
- **Cisco Networkers Presentations**

Global Services You Turn OFF

- **Some services turned on by default, should be turned off to save memory and prevent security breaches/attacks**

`no service finger (before 12.0)`

`no ip finger (from 12.0)`

`no service pad`

`no service udp-small-servers`

`no service tcp-small-servers`

`no ip bootp server`

Interface Services You Turn OFF

- **Some IP features are great for Campus LANs, but do not make sense on a ISP backbone.**
- **All interfaces on an ISP's backbone router should have the follow as a *default*:**

```
no ip redirects
```

```
no ip directed-broadcast (default from 12.0)
```

```
no ip proxy-arp
```

Cisco Discovery Protocol

- Lets network administrators discover neighbouring Cisco equipment, model numbers and software versions
- Should not be needed on ISP network
`no cdp run`
- Must not be activated on any public facing interface:
IXP, customer, upstream ISP
- Disable per interface
`no cdp enable`

Login Banner

- Use a good login banner, or nothing at all:

```
banner login ^
```

```
  Authorised access only
```

```
  This system is the property of Galactic Internet
```

```
  Disconnect IMMEDIATELY if you are not an authorised user!
```

```
  Contact noc@net.galaxy +99 876 543210 for help.
```

```
^
```

Exec Banner

- **Useful to remind logged in users of local conditions:**

```
banner exec ^
```

```
PLEASE NOTE - THIS ROUTER SHOULD NOT HAVE A DEFAULT ROUTE!
```

```
It is used to connect paying peers. These 'customers' should  
not be able to default to us. The config for this router is  
NON-STANDARD.
```

```
Contact Network Engineering +99 876 543234 for more info.
```

```
^
```

Use Enable Secret

- Encryption '7' on a Cisco is reversible.
- The “enable secret” password encrypted via a one-way algorithm.

```
enable secret <removed>
```

```
no enable password
```

```
service password-encryption
```

Turn on Nagle

- Telnet was designed to do one character, one packet dialog.
- John Nagle's algorithm (RFC 896) helps alleviate the small-packet problem in TCP.

`service nagle`

- Lessens the load on the CPU when using “show XXXX” commands

ident Feature

- Identification (*ident*) support allows you to query a Transmission Control Protocol (TCP) port for identification.
- This feature enables an insecure protocol, described in RFC 1413, to report the identity of a client initiating a TCP connection and a host responding to the connection. No attempt is made to protect against unauthorized queries.

`ip ident`

- ISPs are very unlikely to need *ident* capability on any router

VTY and Console port timeouts

- **Default idle timeout on async ports is 10 minutes 0 seconds**

```
exec-timeout 10 0
```

- **Timeout of 0 means permanent connection**
- **TCP keepalives on incoming and outgoing network connections terminating on router**

```
service tcp-keepalives-in
```

```
service tcp-keepalives-out
```

VTY security

- **Access to VTYs should be controlled, not left open. Consoles should be used for last resort admin only:**

```
access-list 3 permit 215.17.1.0 0.0.0.255
access-list 3 deny    any
line vty 0 4
  access-class 3 in
  exec-timeout 5 0
  transport input telnet
  transport output none
  transport preferred none
  password 7 045802150C2E
```

VTY Access and SSH

- **Secure Shell Supported as from IOS 12.0S**
- **Obtain, load and run appropriate crypto images on router**
- **Set up SSH on router**

```
Beta7200(config)#crypto key generate rsa
```

- **Add it as input transport**

```
line vty 0 4
```

```
transport input telnet ssh
```

User Authentication – take 1

- **Account per user, with passwords**

```
aaa new-model
aaa authentication login neteng local
username joe password 7 1104181051B1
username jim password 7 0317B21895FE
line vty 0 4
  login neteng
  access-class 3 in
```

User Authentication – take 2

- **More recent versions of IOS add MD5 encryption for user passwords**

```
aaa new-model
aaa authentication login neteng local
username joe secret 5 $1$j6Ac$3KarJszBV3VMaL/2Nio3E.
username jim secret 5 $1$LPV2$Q04NwAudy0/4AHHQHvWj0
line vty 0 4
  login neteng
  access-class 3 in
```

User Authentication

- **Use centralised authentication system**

RADIUS (not recommended for system security)

TACACS+

```
aaa new-model
aaa authentication login default tacacs+ enable
aaa authentication enable default tacacs+ enable
aaa accounting exec start-stop tacacs+
ip tacacs source-interface Loopback0
tacacs-server host 215.17.1.1
tacacs-server host 215.17.5.35
tacacs-server key CKr3t#
line vty 0 4
  access-class 3 in
```

User Authentication

TACACS+ Provides a detailed audit trail of what is happening on the network devices.

User-Name	Group-Name	cmd	priv-lvl	service	NAS-Portname	task_id	NAS-IP-Address	reason
bgreene	NOC	enable <cr>	0	shell	tty0	4	210.210.51.224

Securing the Network

Route Filtering and Packet Filtering

Ingress & Egress Route Filtering

- There are routes that should NOT be routed on the Internet
 - RFC 1918 and “Martian” Networks
 - 127.0.0.0/8 and Multicast blocks
 - See RFC3330 for background information
- Check Project Cymru’s list of “bogons”:
<http://www.cymru.com/Bogons/>
- BGP should have filters applied so that these routes are not advertised to or propagated through the Internet
- Check Project Cymru’s bogon route server:
<http://www.cymru.com/BGP/bogon-rs.html>

Ingress & Egress Route Filtering

BGP Configuration

```
router bgp 200
no synchronization
bgp dampening
neighbor 220.220.4.1 remote-as 210
neighbor 220.220.4.1 version 4
neighbor 220.220.4.1 prefix-list bogon-filter in
neighbor 220.220.4.1 prefix-list bogon-filter out
neighbor 222.222.8.1 remote-as 220
neighbor 222.222.8.1 version 4
neighbor 222.222.8.1 prefix-list bogon-filter in
neighbor 222.222.8.1 prefix-list bogon-filter out
no auto-summary
!
```

Ingress & Egress Route Filtering

Sample Prefix-list

```
ip prefix-list bogon-filter deny 0.0.0.0/8 le 32
ip prefix-list bogon-filter deny 10.0.0.0/8 le 32
ip prefix-list bogon-filter deny 127.0.0.0/8 le 32
ip prefix-list bogon-filter deny 169.254.0.0/16 le 32
ip prefix-list bogon-filter deny 172.16.0.0/12 le 32
ip prefix-list bogon-filter deny 192.0.2.0.0/24 le 32
ip prefix-list bogon-filter deny 192.168.0.0/16 le 32
ip prefix-list bogon-filter deny 224.0.0.0/3 le 32
ip prefix-list bogon-filter permit 0.0.0.0/0 le 32
```

Ingress & Egress Packet Filtering

Your customers should not be sending *any* IP packets out to the Internet with a source address other than the address you have allocated to them!

Ingress & Egress Packet Filtering

- **BCP 38/ RFC 2827**
- **Title: Network Ingress Filtering: Defeating Denial of Service Attacks which employ IP Source Address Spoofing**
- **Author(s): P. Ferguson, D. Senie**

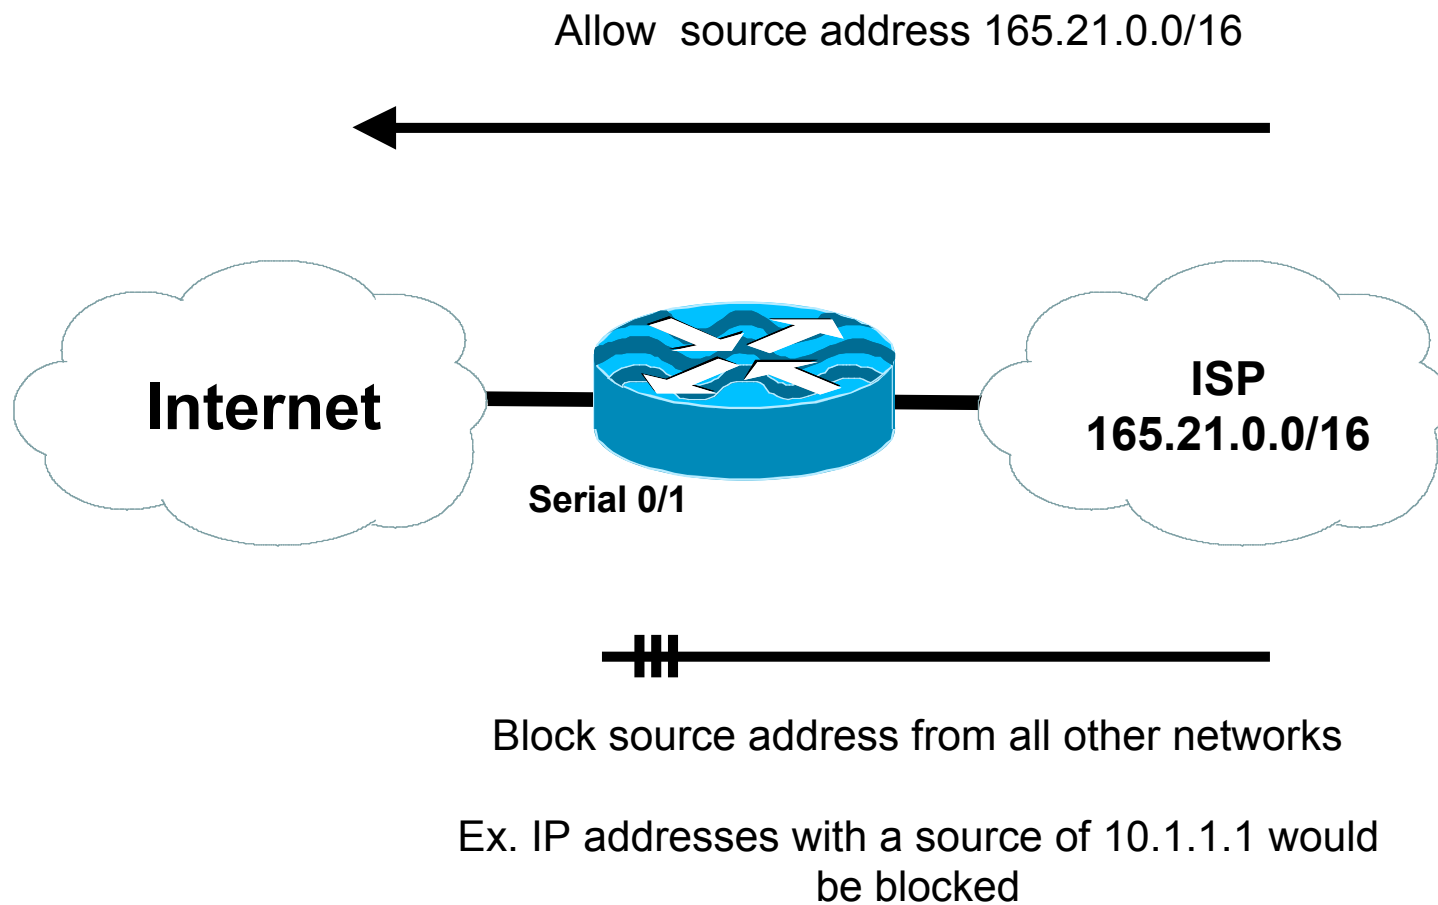

Packet Filtering

- **There are several techniques to implement packet filtering on the edge of the network**

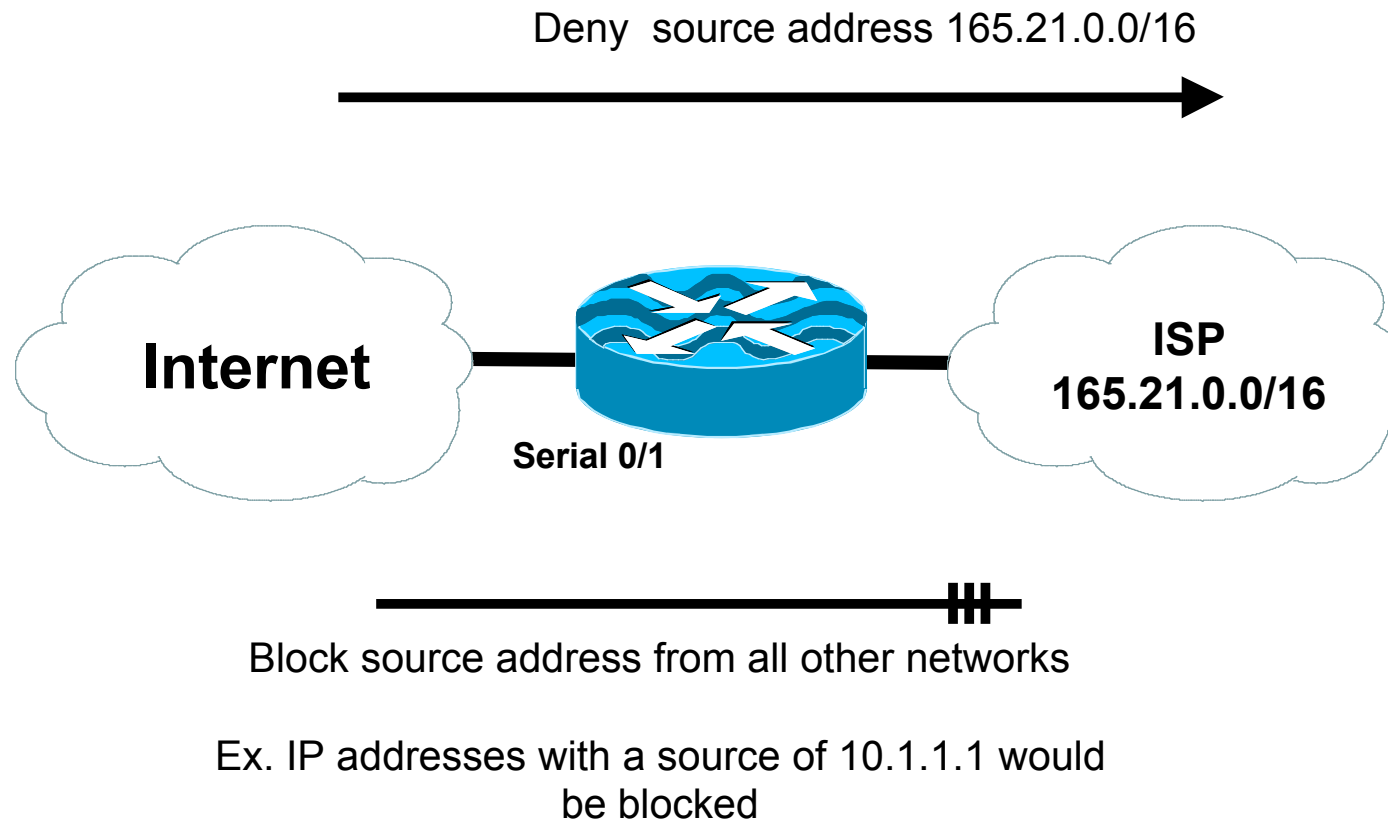

The next have just some examples – by no means complete though

- **Static Access List on the edge of the Network.**
- **Dynamic Access List with AAA Profiles**
- **Unicast RPF**

Outbound Packet Filtering

Inbound Packet Filtering

Reverse Path Forwarding

- **Supported from 11.1(17)CC images**
- **CEF switching must be enabled**
- **Source IP packets are checked to ensure that the route back to the source uses the same interface**
- **Thought/planning required in multihoming situations**

Reverse Path Forwarding

- **IOS Command**

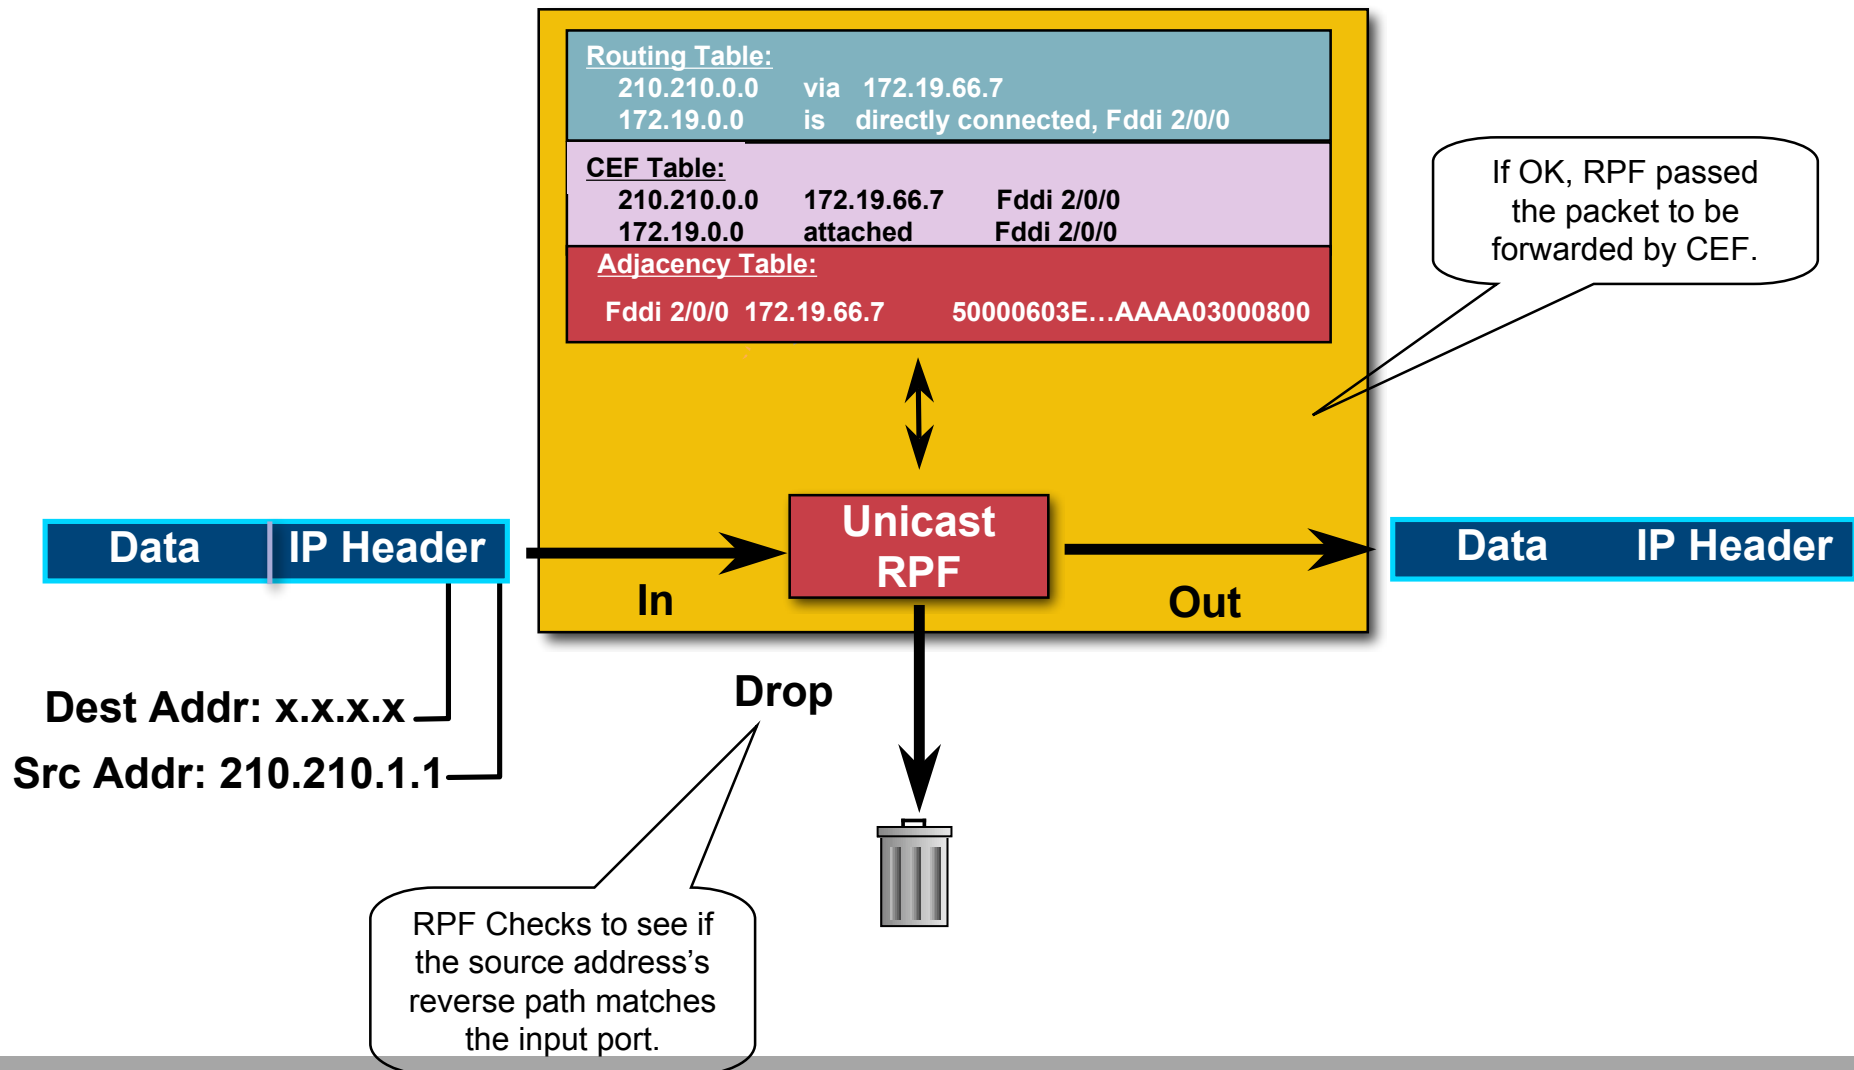

```
interface serial 1/0  
  ip verify unicast reverse-path <acl>
```

- **Access-list has two uses**

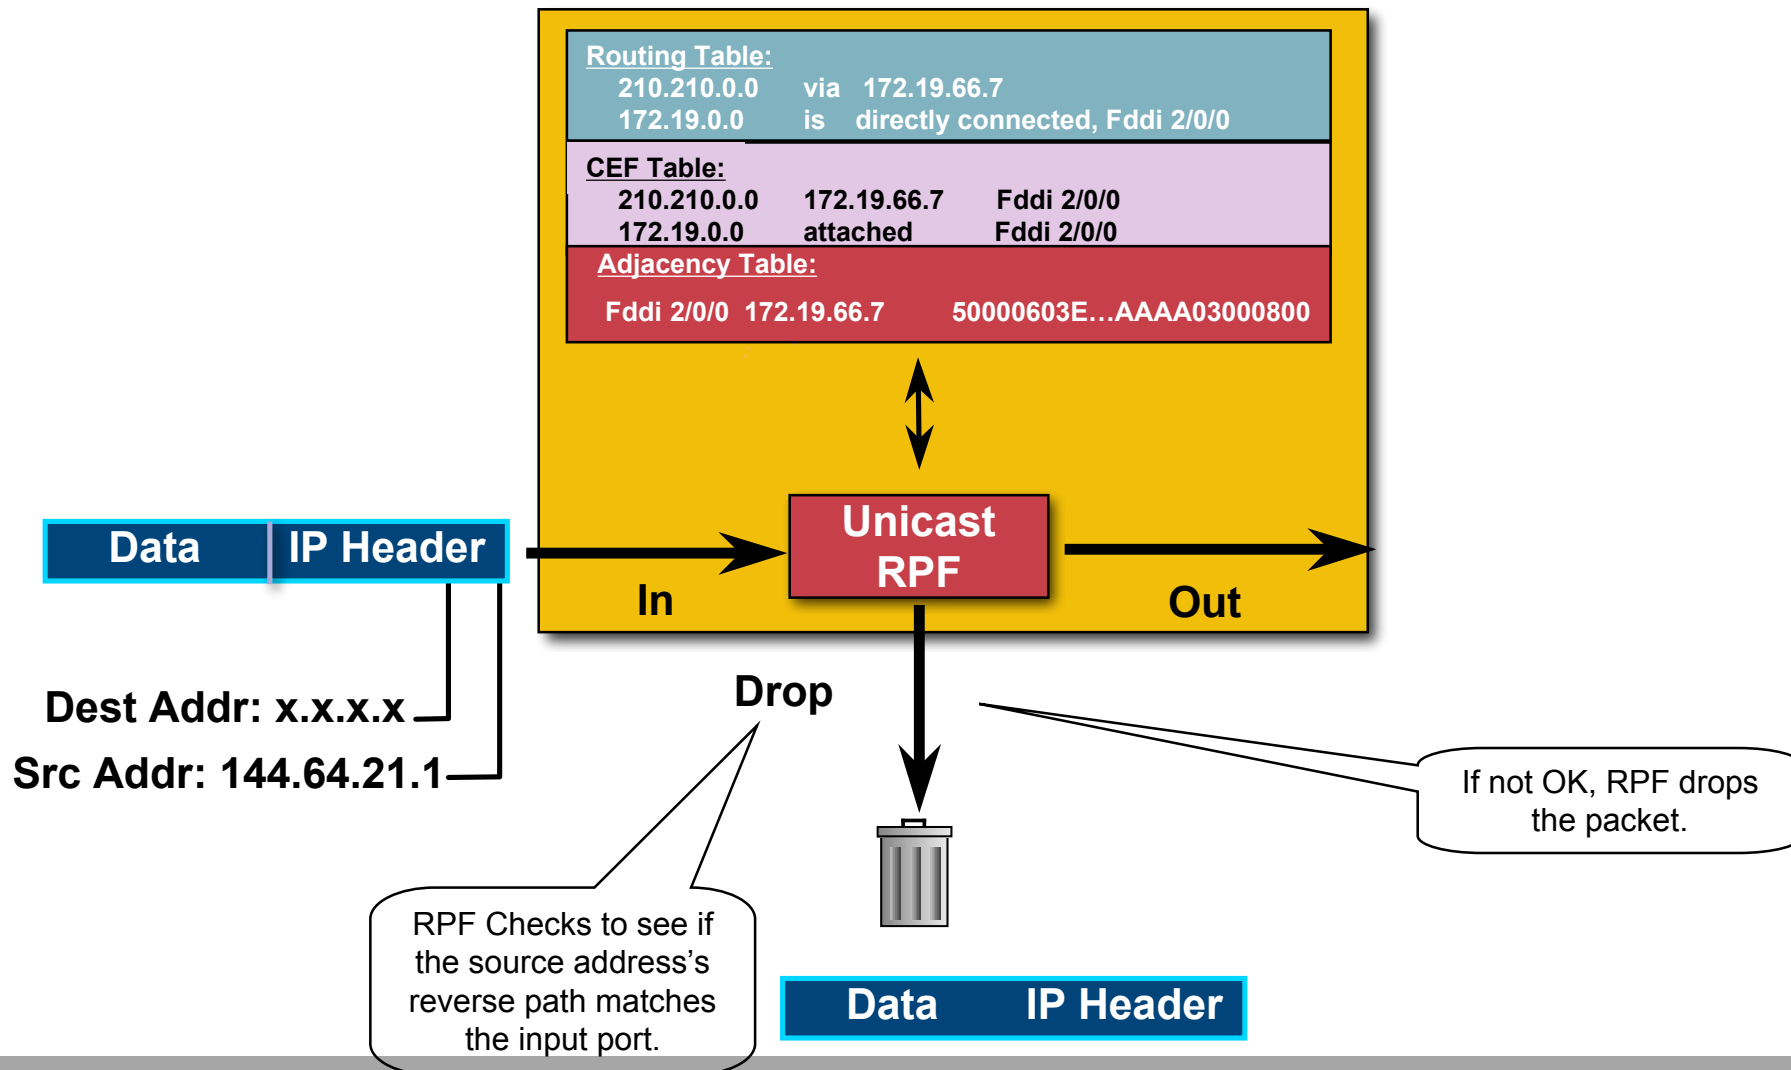

To allow prefixes which have failed the uRPF test (access-list permit statement)

To log uRPF failures (access-list deny log statement)

CEF Unicast RPF

CEF Unicast RPF

Unicast RPF Check

- **Should be mandatory command on all ISP's edge routers connecting customers to the Internet**

Part of IOS Essentials ISP router template

- **Multihomed customers require a little more thought and planning**

Use BGP weight

Use uRPF enhancements (ACL and FIB comparison) in 12.0(14)S

```
ip verify unicast reverse-path <acl>
```

```
ip verify unicast source reachable-via [any|rx] <acl>
```

DoS Attack Prevention Techniques

- **How to prevent your network from being the source of the attack:**

Apply filters to each customer network

Ingress: Allow only those packets with source addresses within the customer's assigned netblocks

Apply filters to your upstreams

Egress: Allow only those packets with source addresses within your netblocks to protect others

Ingress: Deny those packets with source addresses within your netblocks to protect yourself

DoS Attack Prevention Techniques

- **How to suppress an attack if you're the victim:**

Implement ACL's at network edges to block ICMP echo responses to your high-visibility hosts

But: Will impair troubleshooting – “ping” breaks

But: Will still allow your access pipes to fill

Work with upstream providers to determine the help they can provide to you

Blocking ICMP echoes for high-visibility hosts from coming through your access pipes

Tracing attacks

Longer term: Participate in the NSP Security Community

DDoS versus DoS

- Same methods and tools as DoS
- Much larger scale attacks
- Uses hundreds or even thousands of attacking points to overwhelm targets
- Can be difficult to determine difference between DDoS and network outage

DDoS Links
