

# IPv6 Addressing

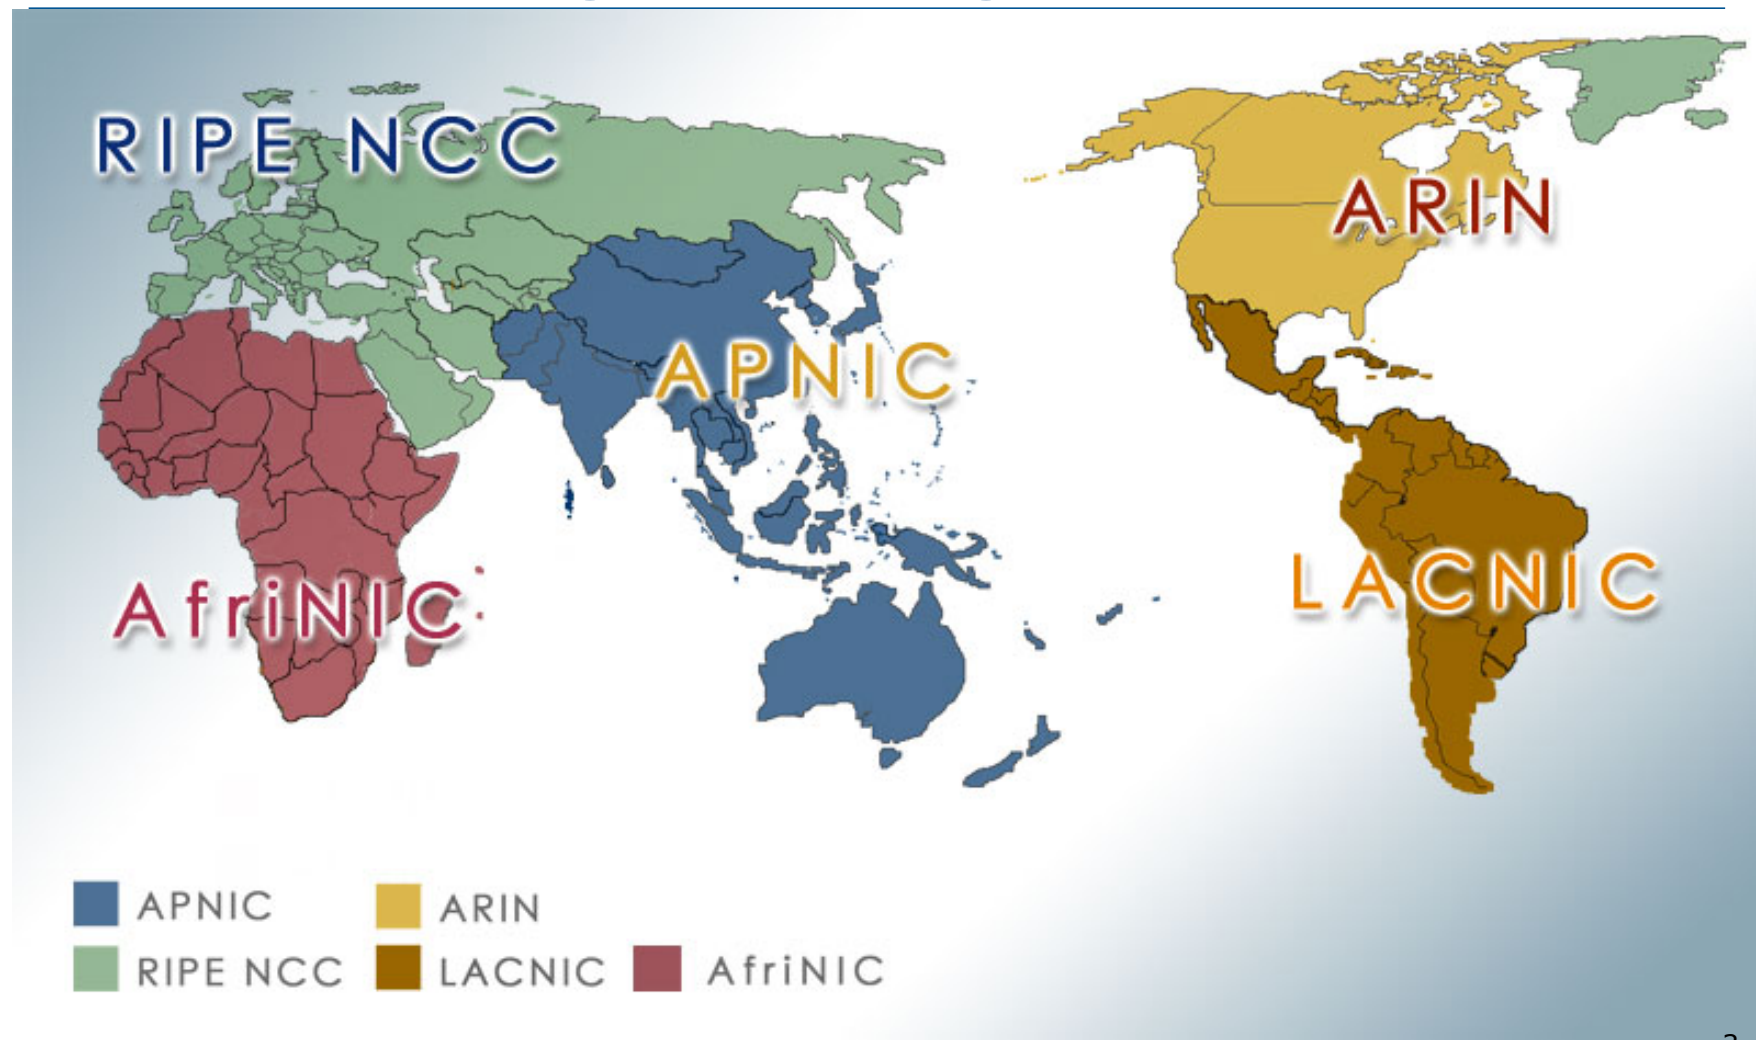

ISP Workshops

# Where to get IPv6 addresses

---

- ❑ Your upstream ISP
- ❑ Africa
  - AfriNIC – <http://www.afrinic.net>
- ❑ Asia and the Pacific
  - APNIC – <http://www.apnic.net>
- ❑ North America
  - ARIN – <http://www.arin.net>
- ❑ Latin America and the Caribbean
  - LACNIC – <http://www.lacnic.net>
- ❑ Europe and Middle East
  - RIPE NCC – <http://www.ripe.net/info/ncc>

# Internet Registry Regions

# Getting IPv6 address space (1)

---

- **From your Regional Internet Registry**
  - Become a member of your Regional Internet Registry and get your own allocation
    - Membership usually open to all network operators
  - General allocation policies are outlined in RFC2050
    - RIR specific policy details for IPv6 allocations are listed on the individual RIR website
  - Open to all organisations who are operating a network
  - Receive a /32 (or larger if you will have more than 65k /48 assignments)

# Getting IPv6 address space (2)

---

- **From your upstream ISP**
  - Receive a /48 from upstream ISP's IPv6 address block
  - Receive more than one /48 if you have more than 65k subnets
- If you need to multihome:
  - Apply for a /48 assignment from your RIR
  - Multihoming with provider's /48 will be operationally challenging
    - Provider policies, filters, etc

# Using 6to4 for IPv6 address space

---

- ❑ Some entities still use 6to4
  - Not recommended due to operational problems
  - Read <http://datatracker.ietf.org/doc/draft-ietf-v6ops-6to4-to-historic> for some of the reasoning why
- ❑ FYI: 6to4 operation:
  - Take a single public IPv4 /32 address
  - 2002:<ipv4 /32 address>::/48 becomes your IPv6 address block, giving 65k subnets
  - Requires a 6to4 gateway
  - 6to4 is a means of connecting IPv6 islands across the IPv4 Internet

# Nibble Boundaries

---

- ❑ IPv6 offers network operators more flexibility with addressing plans
  - Network addressing can now be done on nibble boundaries
    - ❑ For ease of operation
  - Rather than making maximum use of a very scarce resource
    - ❑ With the resulting operational complexity
- ❑ A nibble boundary means subnetting address space based on the address numbering
  - Each number in IPv6 represents 4 bits = 1 nibble
  - Which means that IPv6 addressing can be done on 4-bit boundaries

# Nibble Boundaries – example

---

- Consider the address block 2001:db8:0:10::/61
  - The range of addresses in this block are:

2001:0db8:0000:0010:0000:0000:0000:0000  
to  
2001:0db8:0000:0017:ffff:ffff:ffff:ffff

- Note that this subnet only runs from 0010 to 0017.
- The adjacent block is 2001:db8:0:18::/61

2001:0db8:0000:0018:0000:0000:0000:0000  
to  
2001:0db8:0000:001f:ffff:ffff:ffff:ffff

- The address blocks don't use the entire nibble range

# Nibble Boundaries – example

---

- Now consider the address block 2001:db8:0:10::/60
  - The range of addresses in this block are:

2001:0db8:0000:0010:0000:0000:0000:0000  
to  
2001:0db8:0000:001f:ffff:ffff:ffff:ffff

- Note that this subnet uses the entire nibble range, 0 to f
- Which makes the numbering plan for IPv6 simpler
  - This range can have a particular meaning within the ISP block (for example, infrastructure addressing for a particular PoP)

# Addressing Plans – Infrastructure

---

- ❑ All Network Operators should obtain a /32 from their RIR
- ❑ Address block for router loop-back interfaces
  - Number all loopbacks out of **one** /64
  - /128 per loopback
- ❑ Address block for infrastructure (backbone)
  - /48 allows 65k subnets
  - /48 per region (for the largest multi-national networks)
  - /48 for whole backbone (for the majority of networks)
  - Infrastructure/backbone usually does NOT require regional/geographical addressing
  - Summarise between sites if it makes sense

# Addressing Plans – Infrastructure

---

- ❑ What about LANs?
  - /64 per LAN
- ❑ What about Point-to-Point links?
  - Protocol design expectation is that /64 is used
  - /127 now recommended/standardised
    - ❑ <http://www.rfc-editor.org/rfc/rfc6164.txt>
    - ❑ (reserve /64 for the link, but address it as a /127)
  - Other options:
    - ❑ /126s are being used (mimics IPv4 /30)
    - ❑ /112s are being used
      - Leaves final 16 bits free for node IDs
    - ❑ Some discussion about /80s, /96s and /120s too

# Addressing Plans – Infrastructure

---

## □ NOC:

- ISP NOC is “trusted” network and usually considered part of infrastructure /48
  - Contains management and monitoring systems
  - Hosts the network operations staff
  - take the last /60 (allows enough subnets)

## □ Critical Services:

- Network Operator’s critical services are part of the “trusted” network and should be considered part of the infrastructure /48
- For example, Anycast DNS, SMTP, POP3/IMAP, etc
  - Take the second /64
  - (some operators use the first /64 instead)

# Addressing Plans – ISP to Customer

---

## □ Option One:

- Use ipv6 unnumbered
- Which means no global unicast ipv6 address on the point-to-point link
- Router adopts the specified interface's IPv6 address
  - Router doesn't actually need a global unicast IPv6 address to forward packets

```
interface loopback 0
  ipv6 address 2001:db8::1/128
interface serial 1/0
  ipv6 address unnumbered loopback 0
```

# Addressing Plans – ISP to Customer

---

## □ Option Two:

- Use the second /48 for point-to-point links
- Divide this /48 up between PoPs
- Example:
  - For 10 PoPs, dividing into 16, gives /52 per PoP
  - Each /52 gives 4096 point-to-point links
  - Adjust to suit!
- Useful if ISP monitors point-to-point link state for customers
  - Link addresses are **untrusted**, so do not want them in the first /48 used for the backbone &c
- Aggregate per router or per PoP and carry in iBGP (not ISIS/OSPF)

# Addressing Plans – Customer

---

- ❑ Customers get **one** /48
  - Unless they have more than 65k subnets in which case they get a second /48 (and so on)
- ❑ In typical deployments today:
  - Several ISPs are giving small customers a /56 and single LAN end-sites a /64, e.g.:
    - /64        if end-site will only ever be a LAN
    - /56        for small end-sites (e.g. home/office/small business)
    - /48        for large end-sites
  - This is another very active discussion area
  - Observations:
    - ❑ Don't assume that a mobile endsite needs only a /64
    - ❑ Some operators are distributing /60s to their smallest customers!!

# Addressing Plans – Customer

---

- ❑ Consumer Broadband Example:
  - DHCPv6 pool is a /48
    - ❑ DHCPv6 hands out /60 per customer
    - ❑ Which allows for 4096 customers per pool
- ❑ Business Broadband Example:
  - DHCPv6 pool is a /48
    - ❑ DHCPv6 hands out /56 per customer
    - ❑ Which allows for 256 customers per pool
  - If BRAS has more than 256 business customers, increase pool to a /47
    - ❑ This allows for 512 customers at /56 per customer
  - Increasing pool to /46 allows for 1024 customers
  - BRAS announces entire pool as one block by iBGP

# Addressing Plans – Customer

---

- ❑ Business “leased line”:
  - /48 per customer
  - One stop shop, no need for customer to revisit ISP for more addresses until all 65k subnets are used up
- ❑ Hosted services:
  - One physical server per vLAN
  - One /64 per vLAN
  - How many vLANs per PoP?
  - /48 reserved for entire hosted servers across backbone
    - ❑ Internal sites will be subnets and carried by iBGP

# Addressing Plans – Customer

---

- ❑ Geographical delegations to Customers:
  - Network Operator subdivides /32 address block into geographical chunks
  - E.g. into /36s
    - ❑ Region 1: 2001:db8:1xxx::/36
    - ❑ Region 2: 2001:db8:2xxx::/36
    - ❑ Region 3: 2001:db8:3xxx::/36
    - ❑ etc
  - Which gives 4096 /48s per region
  - For Operational and Administrative ease
  - Benefits for traffic engineering if Network Operator multihomes in each region

# Addressing Plans – Customer

---

- ❑ Sequential delegations to Customers:
  - After carving off address space for network infrastructure, Network Operator simply assigns address space sequentially
  - Eg:
    - ❑ Infrastructure: 2001:db8:0::/48
    - ❑ Customer P2P: 2001:db8:1::/48
    - ❑ Customer 1: 2001:db8:2::/48
    - ❑ Customer 2: 2001:db8:3::/48
    - ❑ etc
  - Useful when there is no regional subdivision of network and no regional multihoming needs

# Addressing Plans – Routing Considerations

---

- ❑ Carry Broadband pools in iBGP across the backbone
  - Not in OSPF/ISIS
- ❑ Multiple Broadband pools on one BRAS should be aggregated if possible
  - Reduce load on iBGP
- ❑ Aggregating leased line customer address blocks per router or per PoP is undesirable:
  - Interferes with ISP's traffic engineering needs
  - Interferes with ISP's service quality and service guarantees

# Addressing Plans – Traffic Engineering

---

- ❑ Smaller providers will be single homed
  - The customer portion of the ISP's IPv6 address block will usually be assigned sequentially
- ❑ Larger providers will be multihomed
  - Two, three or more external links from different providers
  - Traffic engineering becomes important
  - Sequential assignments of customer addresses will negatively impact load balancing

# Addressing Plans – Traffic Engineering

---

- ❑ ISP Router loopbacks and backbone point-to-point links make up a small part of total address space
  - And they don't attract traffic, unlike customer address space
- ❑ Links from ISP Aggregation edge to customer router needs one /64
  - Small requirements compared with total address space
  - Some ISPs use IPv6 unnumbered
- ❑ Planning customer assignments is a very important part of multihoming
  - Traffic engineering involves subdividing aggregate into pieces until load balancing works

# Unplanned IP addressing

- ISP fills up customer IP addressing from one end of the range:

- Customers generate traffic
  - Dividing the range into two pieces will result in one /33 with all the customers and the ISP infrastructure the addresses, and one /33 with nothing
  - No loadbalancing as all traffic will come in the first /33
  - Means further subdivision of the first /33 = harder work

# Planned IP addressing

- If ISP fills up customer addressing from both ends of the range:

- Scheme then is:
  - First customer from first /33, second customer from second /33, third from first /33, etc
- This works also for residential versus commercial customers:
  - Residential from first /33
  - Commercial from second /33

# Planned IP Addressing

---

- ❑ This works fine for multihoming between two upstream links (same or different providers)
- ❑ Can also subdivide address space to suit more than two upstreams
  - Follow a similar scheme for populating each portion of the address space
- ❑ Consider regional (geographical) distribution of customer delegated address space
- ❑ Don't forget to always announce an aggregate out of each link

# Addressing Plans – Advice

---

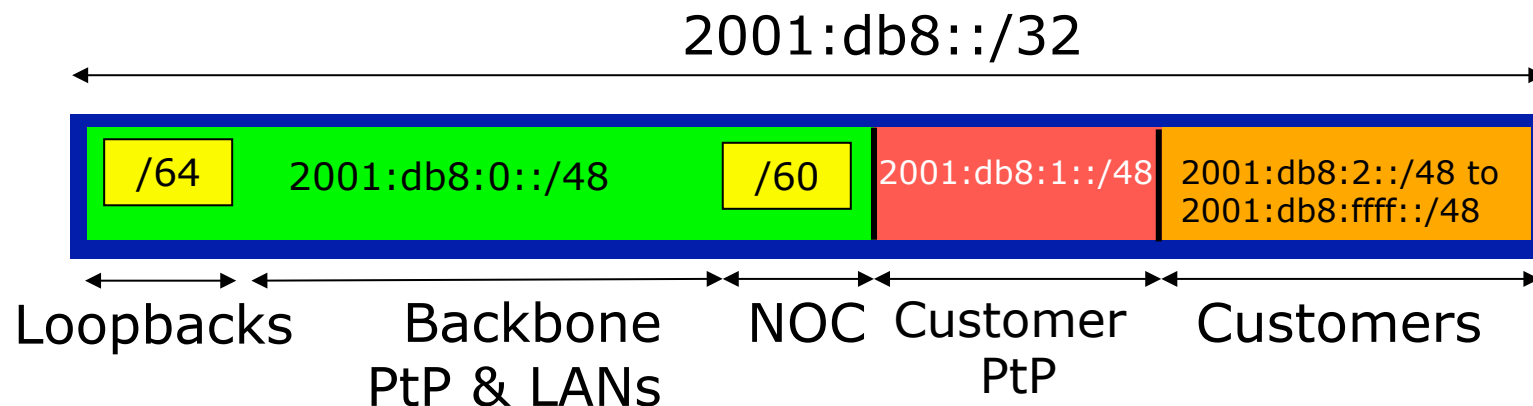

- ❑ Customer address assignments should not be reserved or assigned on a per PoP basis
  - Follow same principle as for IPv4
  - Subnet aggregate to cater for multihoming needs
  - Consider regional delegation
  - ISP iBGP carries customer nets
  - Aggregation within the iBGP not required and usually not desirable
  - Aggregation in eBGP is very necessary
- ❑ Backbone infrastructure assignments:
  - Number out of a **single** /48
    - ❑ Operational simplicity and security
  - Aggregate to minimise size of the IGP

# Addressing Plans – Scheme

## □ Looking at Infrastructure:

## □ Alternative:

# Addressing Plans

## Planning

---

- Registries will usually allocate the next block to be contiguous with the first allocation
  - (RIRs use a sparse allocation strategy – industry goal is aggregation)
  - Minimum allocation is /32
  - Very likely that subsequent allocation will make this up to a /31 or larger (/28)
  - So plan accordingly

# Addressing Plans (contd)

---

- ❑ Document infrastructure allocation
  - Eases operation, debugging and management
- ❑ Document customer allocation
  - Customers get /48 each
  - Prefix contained in iBGP
  - Eases operation, debugging and management
  - Submit network object to RIR Database

# Addressing Tools

---

- ❑ Examples of IP address planning tools:
  - NetDot [netdot.uoregon.edu](http://netdot.uoregon.edu) (recommended!!)
  - HaCi [sourceforge.net/projects/haci](http://sourceforge.net/projects/haci)
  - IPAT [nethead.de/index.php/ipat](http://nethead.de/index.php/ipat)
  - freeipdb [home.globalcrossing.net/~freeipdb/](http://home.globalcrossing.net/~freeipdb/)
- ❑ Examples of IPv6 subnet calculators:
  - ipv6gen [code.google.com/p/ipv6gen/](http://code.google.com/p/ipv6gen/)
  - sipcalc [www.routemeister.net/projects/sipcalc/](http://www.routemeister.net/projects/sipcalc/)
